AgenticStarter

// BRAND IDENTITY GUIDE — V1.0

Engineering Intelligence.

Not Guessing It.

> The open source framework that transforms LLM development from experimental hacking into structured, scalable engineering.

// INDEX

Contents

This document defines the complete visual and strategic identity of Agentic Starter — from positioning to pixels.

01 **Brand Strategy**
Positioning, promise, personality, audience

02 **Tone of Voice**
How the brand speaks — rules and examples

03 **Logo System**
Primary mark, variants, construction, safe space

04 **Color Palette**
Dark-first system, roles, usage rules

05 **Typography**
Font families, hierarchy, pairing rationale

06 **Application Guidelines**
Usage rules, don'ts, example contexts

// 01

Brand Strategy

The strategic foundation every visual and verbal decision is built upon.

POSITIONING STATEMENT

Agentic Starter is the **open source engineering framework** that brings structure, process, and reliability to LLM development — for developers and teams who are done improvising and ready to build AI systems that actually work in production.

BRAND PROMISE

We give developers the scaffolding to build intelligent systems with the same discipline they'd apply to any serious engineering project.

// PERSONALITY PILLARS

Five Adjectives

The character traits that guide every brand decision — visual and verbal.

Disciplined

We believe structure is a feature, not a constraint. Every decision is intentional — from architecture to commit messages.

Precise

No vagueness. No "it depends." We say exactly what we mean, and our tools do exactly what they promise.

Elegant

Clean, minimal, intentional — in code and in design. Complexity is managed, never displayed.

Uncompromising

We don't cut corners on process. TDD, specs, validation — these aren't optional. Neither is quality.

Pragmatic

We respect real-world engineering. Theory earns its place only when it ships better software. We skip the hype and ship.

// TARGET AUDIENCE

Who We Build For

Two profiles, one shared frustration: LLM projects that don't scale.

M

Marcus Chen

Senior Backend Engineer / Tech Lead — 6 years experience

Marcus has been asked to ship an AI feature in 6 weeks. He's used LangChain before but hated how quickly it became a mess. He wants something with guardrails — not training wheels. He values code review culture, hates "works on my machine," and reads architecture blog posts on weekends. His pain point: his team keeps shipping fragile AI code nobody understands.

Python | Production-first | TDD advocate | GitHub-native | Skeptical of hype

A

Aisha Reyes

Mid-Level ML Engineer — 2 years experience

Aisha knows how to train models but is new to building LLM-powered applications. She's tired of tutorials that leave her with spaghetti code. She wants a framework that teaches her the right way to do things — not just the fast way. She's ambitious, learns from GitHub repos, and wants to be taken seriously by senior devs.

Learning in public | Notebook → production | Wants patterns | Global / EN | OSS contributor

// 02

Tone of Voice

Agentic Starter speaks like a senior engineer who's seen too many AI projects fail — and built the solution. Direct, confident, zero fluff.

✓ DO

✓ BE DIRECT

"Define the spec before you write the code. Always."

✓ RESPECT EXPERTISE

"Agents pick tools. Skills load context. Tests enforce behavior."

✓ OWN THE PROBLEM

"Most LLM projects fail in production. We fix the root cause: no process."

✓ CONFIDENT, NOT ARROGANT

"This is the way to build LLM systems. Not the only way — but the one that ships."

✗ DON'T

✗ AVOID HEDGING

"You might want to consider thinking about perhaps defining some kind of spec..."

✗ OVER-EXPLAIN

"An agent, which is a kind of AI system, can do things like choose between different tools, which are pieces of software that..."

✗ BE VAGUE

"Agentic Starter helps improve your AI experience for better outcomes."

✗ DISMISSIVE

"LangChain is a toy. Anyone using it seriously is doing it wrong."

VOICE IN ONE SENTENCE

"Engineering clarity in a world of LLM chaos."

If a piece of writing sounds like it could come from a startup marketing team, rewrite it. If it sounds like a senior dev explaining architecture to a peer, it's right.

// 03

Logo System

A geometric hexagon mark containing the letter A — representing Agent, Architecture, and the structured approach to AI engineering. Sharp edges signal precision; the open shape signals process and flow.

Agentic
Starter

Primary — Dark Background

Icon only — Avatar / Favicon

Monochrome — Light Background

LOGO CONSTRUCTION NOTES

The outer hexagon (double-ring) represents the structured framework layer. The inner filled hexagon is the engine — dark, contained, controlled. The A-mark inside is sharp at the top (precision) and open at the bottom (accessible to all devs). The accent dot at the node signals an active agent. Never use drop shadows, gradients on the mark itself, or colored backgrounds that reduce contrast below 4.5:1.

// 04

Color Palette

Dark-first. The palette is built around deep, near-black backgrounds that evoke the terminal — and a single precision accent that cuts through: Electric Mint. This is the color of confirmation. Of a test passing. Of an agent completing its task.

Electric Mint
Primary Accent — CTA, highlights, active states
#00E5B4

Agent Violet
Secondary Accent — Tags, skills, code references
#7C6FEE

Void
Page Background
#0A0B0E

Cloud
Primary Text
#F0F2F5

Smoke
Secondary Text
#8A95A3

Wire
Borders / Dividers
#1E2430

// 05

Typography

Three fonts. Three roles. Zero compromise.

DISPLAY / HEADLINE — SPACE GROTESK

Build AI
that ships.

Geometric sans-serif with just enough personality. Strong in bold, elegant at regular weight. Letterforms engineered for screens.

Usage: Hero titles, section headers, logo wordmark, README headings, slide titles

BODY / UI — INTER

The Agentic Starter enforces a spec-first workflow — before any code is written, the problem is defined, requirements are detailed, and a design is validated. This prevents LLMs from generating unanchored code, and gives your team a shared contract to test against.

Usage: Body copy, documentation, README prose, UI labels, descriptions

CODE / ACCENT — JETBRAINS MONO

```
// Phase 1: spec.md
agent.define_problem(context=spec)
agent.validate_requirements()
agent.run_task(task="implement")
```

Usage: Code samples, version tags, technical labels, metadata, eyebrow text

TYPE HIERARCHY

H1	# Engineering Intelligence.	Space Grotesk 700 / 36px
H2	## SDD — Spec Driven Development	Space Grotesk 600 / 24px
Body	Define. Validate. Build. In that order.	Inter 400 / 14px
Caption	// V1.0.0 — OPEN SOURCE	JetBrains Mono 400 / 11px

Application Guidelines

Rules for consistent brand application across all touchpoints.

✓ DO

- ✓ **Use Electric Mint as the single accent.** One dominant accent maintains visual discipline.
- ✓ **Maintain a dark background at all times.** Light modes are not part of this identity.
- ✓ **Use JetBrains Mono for all labels, metadata, and code.** It signals technical credibility.
- ✓ **Keep logo safe space equal to the height of the hexagon** on all four sides.

✗ DON'T

- ✗ **Never use the logo on colored backgrounds** without testing contrast. Only dark (#0A0B0E) or white.
- ✗ **Never add drop shadows or gradients** to the logo mark. It must remain sharp and flat.
- ✗ **Never use more than two accent colors** in the same composition. Violet supports; Mint leads.
- ✗ **Never use rounded, bubbly, or decorative typefaces.** They conflict with the disciplined brand identity.

Example Contexts

GitHub README

Dark mode terminal-style hero image with logo + tagline. Mint accent on key terms. JetBrains Mono for install commands. Space Grotesk headers.

Conference Slides

Dark background, single accent per slide. Architectural diagrams use Wire (#1E2430) borders with Mint for active nodes. No clipart, no stock illustrations.

Social / Twitter

Code snippets on dark cards, logo in corner. Short, direct copy in Space Grotesk. Never use colorful gradients or stock imagery — signal precision at every touch.
